

TraceIt

-A *Tracing App*

Features Planned:

A tracing app to load in an image, draw on the image, then save only the drawing.

We also wanted the app to have advanced drawing tools such as brush width and brush color.

Features Implemented:

Local image loading:

App can load in a picture from local files.

Drawing tools:

User can adjust brush size, brush color, image opacity, and undo actions in reverse order.

Flickr image loading:

App can load in a photo from Flickr.

Saving Tracing:

User can save the drawn lines without the background image they traced on along with a chosen background color.

External Data Source

We used Flickr to load images from the internet.

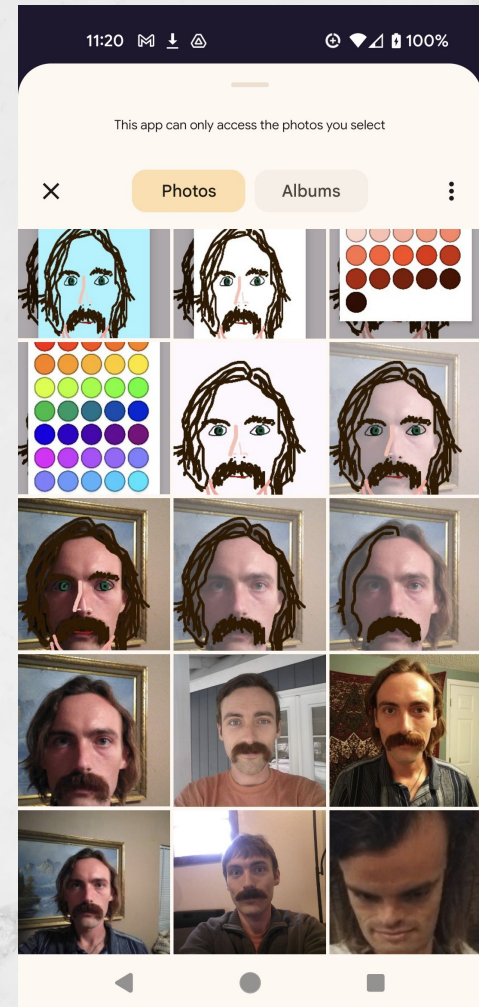

These images can be traced on in our app, without saving them with the drawing.

Use of another app on the Device:

We set it up so the user can pick to load a local image

The local image loading uses the files application on the device.

Lessons Learned

Understanding of Kotlin:

Building a unguided project created a better understanding of the moving parts of Kotlin. Using the class content in a “real world” situation solidified the whole process.

When to start over:

We put a fair amount of work into our first app before deciding to change gears. We worked as a group to decide when to cut our losses and move forward with a different idea rather than get stuck on the first idea.

Demo
